

Intermittent fasting interest: Polish vs Czech Wikipedia

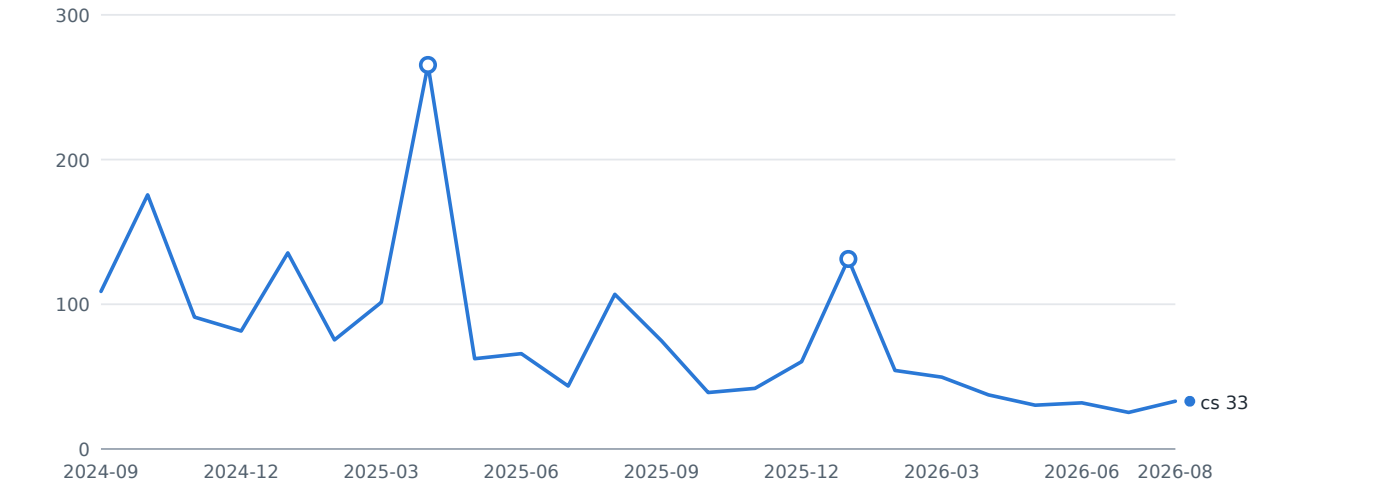

Wikimedia pageviews API · 2024-09 – 2026-08 · monthly, human (non-bot) traffic, all platforms

Interest in intermittent fasting is declining sharply on Czech Wikipedia (-51% YoY), while Polish Wikipedia has no dedicated article on the topic.

Series (article)	Views/mo	Per 1M	Rel. YoY	Raw YoY	Edition	Spikes	Trust
cs (Přerušovaný půst)	183	3	-50.5%	-58%	-16.1%	2	high 70

Intermittent fasting: indexed growth (median of first 6 months = 100)

2024-09 → 2026-08 · human views, each series rebased to its own start · ○ = spike month

Findings

- Czech Wikipedia shows strong decline in article views despite existing article Přerušovaný půst (183 views/month, -58% raw decline)
- Polish Wikipedia lacks a dedicated intermittent fasting article, only related proxies like Głodówka lecznicza (therapeutic fasting) exist
- Whole Czech edition declined -16% YoY, making relative decline measurement crucial for fair comparison

Assumptions & limits

- Data warning: excluded Intermittent fasting@pl: no article on this topic in those editions (a finding in itself — small or young audience). To use a proxy article, pick one from "excluded[].searchHits" or scripts/resolve.ts --search and pass --articles <lang>=<Title>".
- Pageviews measure curiosity, not willingness to pay; validate promising directions with a landing page or ads test.
- Human traffic only (agent=user); undetected bots may remain. Spike months are marked; median-based growth ignores them.
- Rel. YoY = change of the topic's share of all views in that edition; it assumes the edition-wide decline (Edition column) hits all topics equally.
- Per-1M values divide by all views of each language edition: fair across editions, but a small edition can look 'hotter' while tiny in absolute terms.
- One article per topic; broad topics (a course) deserve a basket of related articles.
